Record from keyboard in real time, Edit voice directly, Manage dictation process, Record directly from microphone. The possibility to record audio from your computer's microphone (internal or external) and to edit it in real time is a

highly appreciated feature. The KEYMACRO app does offer this functionality, but it comes with some inconveniences. One-key fast-forward While recording, there's a point in time after which you can press a single key to skip ahead, but it's not entirely convenient. You'd have to know when to press the key, and a single misstep can cause you to lose what you recorded. All-in-one-but-still-sluggish Besides recording, the KEYMACRO app also allows you to edit the audio file directly. This can come in handy, but its performance doesn't exactly live up to expectations. We managed to edit audio files of around five minutes in length, but we had to sit through several seconds of pauses in the middle of the recording. What's more, the length of the files we were

---

able to edit was pretty limited, as the files we tried to edit appeared to be only a few seconds long. Inconvenient data loss prevention The KeyMACRO app is one of the most useful tools when it comes to recording audio directly from your computer, but it's still a beta application, and the developer has been plagued with issues since its initial release in 2010. One bug that was fixed was the inability to change a microphone recording from its original audio format to an AAC format, but that was only temporary. Since then, the app has been incapable of preventing data loss, meaning you can delete files accidentally without realizing it. The KEYMACRO app might be an app worth a try for some users, but it's not a stable one for the average user. Doxa Reader
