Although this was not a keynote devoted to programming languages, Cook's talk was well-received in that it offered up a glimpse into the direction of Mac OS development and how that may influence and integrate with existing and future programming languages. Mac OS X 10.10 Codename "Yosemite" will not be open-sourced The most talked about part of the presentation was Mac OS X 10.10, and why Apple has refrained from making this operating system itself open-source. Yes, even though the operating system in question is 10.10, and the operating system in question is meant to update the idea of "the Mac," if Apple has plans to make Mac OS X open source, there is no reference to that in the presentation, which made it easy for many to assume that the company is doing so, as Tim Cook's opinion that Apple is "not in the business of open source" seems to be the only thing of note. It's easy to read too much into a speech or a presentation, and this one is no exception. Part of the reason that people interpreted Cook's words as though Apple was open-sourcing Mac OS X is that this is the talk in a keynote devoted to the future of programming languages, an area that is typically the domain of open-source developers. That doesn't really seem fair to Cook, though, since Apple's fallback on Mac OS X may mean that its messaging may lack some information on upcoming releases. That was the case for Mac OS X 10.10, according to the report. Mac OS X 10.10 Codename "Yosemite" to debut in late fall With the lack of details on Mac OS X 10.10, the recent 10.9 updates, and the reality that Apple is no longer in the business of open-source development, Mac OS X 10.10 is likely
