What's New In Data Visualization?

In this video we will discuss how to make data visualizations from Microsoft SQL Server database. We will explain the concepts of data visualization in SQL Server, like data visualizing using SQL Server Reporting Services, How to create tables in SQL Server and make data visualization using Data Visualization from SSRS Visual Query Visual Query is an open source, web based and easy to use query builder for the purpose of building dynamic SQL. As an alternative to Power Query, it is a tool for those who wish to build dynamic SQL with standard M language. It is based on M language's 'ODBC query builder'. It is a stand-alone tool and does not depend on other SQL query tools. SQL Server Database Visualization In this video we will learn how to take an SSIS package and actually visualize its structure. This is also an excellent way of understanding the package. The best part about this is you do not need any special training with SSIS. These are just simple steps for the process. The first thing we need to do is to get an instance of SQL Server. There are many ways to do that, but the cheapest and easiest is by using SQL Server 2008 R2 Datacenter. It is free, but it is limited to 10 databases. So, let's start the process by installing SQL Server 2008 R2. First, we need to

download the SQL Server installers from the Microsoft website. In this video we will use SQL Server 2008 R2 Express Edition. But this works for any version, even for Enterprise Edition. Once we have it, we need to install it.
